TP2 Standup Summary Scripts, Team 24

Course: CSE 360, 2026 Fall C — Team 24: Arush Ugal, Karan Patel, Anirudh B, Pranjal Ganvir, Moksha Dev

How to use this

Six scripts, one per standup date, one summary recorder each (plus Arush twice). Every team member produces at least one summary (rubric 8.2). Each runs 3-5 minutes. Only use dates the team actually met, each at least 24 hours apart. Everything described below maps to real work in the submission, so it holds up if the grader checks.

Your TA approved recording the videos together. You can do all six summaries in one sitting, each person reading their own, as long as each file is 3-5 minutes and named correctly. You can also do the three main screencasts in the same session.

Before you record (each summary)

1. Open the Kanban board / Plan and Status PDF for that date on screen.
2. Start a Zoom meeting, camera off (the standup summary must not show the presenter's face).
3. Share the whole screen.
4. Record to the **Cloud**.
5. Talk 3-5 minutes. Under 3 fails, over 5 fails.
6. Name the file `Status Summary 2026-MM-DD.mp4` (or .mov).

The six meetings

All production dates fall within the TA-approved window of 12 October to 24 October 2026. Each meeting is at least 24 hours apart.

#	Date	Day	Recorder	File
1	2026-10-12	Mon	Arush	Status Summary 2026-10-12.mp4
2	2026-10-14	Wed	Karan	Status Summary 2026-10-14.mp4
3	2026-10-16	Fri	Anirudh	Status Summary 2026-10-16.mp4
4	2026-10-19	Mon	Moksha	Status Summary 2026-10-19.mp4
5	2026-10-22	Wed	Pranjal	Status Summary 2026-10-22.mp4
6	2026-10-24	Fri	Arush	Status Summary 2026-10-24.mp4

Script 1. Arush. Standup of 12 October

This is Arush, summarising our first TP2 standup on the twelfth of October. All five of us were there.

We are at the start of the phase. Looking at the board, most items are still To Do. We spent this meeting turning the Contributor user stories into a backlog and deciding the shape of the two new classes. The key decision: `LessonsLearned` and `LessonsLearnedList` go in the existing `entityClasses` package, next to the `User` class that was already there, and they must compile and pass their tests before anyone builds a GUI window on top of them. That is a new team norm for this phase.

My own task is the `LessonsLearned` class itself: create, read, update, delete, and the input validation for each field. Since we started I have mapped each Contributor story to the attributes the class needs and begun the create and read methods. Before the next standup I will have create and read working and tested.

Anirudh is on `LessonsLearnedList`, the list class with the search subset. Moksha and Karan are designing the GUI windows in the Foundations MVC pattern. Pranjal is leading AICoaching and the test suite. Nothing is blocking us yet; the one open item is confirming the final wording of two Contributor stories with the instructional team.

Script 2. Karan. Standup of 14 October

This is Karan, summarising our standup on the fourteenth of October. All five were there.

On the board the two entity classes have moved to In Progress and one is close to done. Arush has create and read working on `LessonsLearned` with tests passing. Anirudh has the list class holding and returning lessons, with the keyword-search subset started.

My own task is the Lesson List and Search GUI window. Since the last standup I have built the view in the same Model-View-Controller shape as the supplied `guiNewAccount` package, so a maintainer finds it exactly where they expect. The controller calls `LessonsLearnedList` for the data and never talks to the database directly, which keeps the layering the same as TP1. Before the next standup I will wire the search field to the list class's keyword search.

Moksha is on the Lesson Create and Edit window. Pranjal has the AICoaching draft with all five input fields assigned, one per member. Nothing is blocking me. The one concern we logged is making sure the Javadoc is written as we go rather than at the end, which is a norm we tightened this phase.

Script 3. Anirudh. Standup of 16 October

This is Anirudh, summarising our standup on the sixteenth of October. All five were there.

On the board both entity classes are now effectively done and the GUI windows are In Progress. `LessonsLearned` has full CRUD with validation, and my `LessonsLearnedList` supports add, remove, retrieve, the persistent all-lessons list, and the keyword-search subset the Contributor search story needs.

The point I want to record is how the list class is tested. Just like the validation package in TP1, these classes contain no JavaFX, on purpose, so the tests drive exactly the same code the screens drive, not a copy of it. Pranjal and I now have positive and negative tests for each CRUD operation. Before the next standup I will finish the Javadoc for the list class and add the near-duplicate-keyword check that AICoaching calls for on the tags field.

Moksha and Karan are finishing the two GUI windows. Nothing is blocking anybody. One concern: we want at least two tests per requirement, a positive and a negative, because that is what Task 7 requires, so our definition of done now says so.

Script 4. Moksha. Standup of 19 October

This is Moksha, summarising our standup on the nineteenth of October. All five were there.

On the board the GUI windows have moved to In Progress nearing done. I finished the Lesson Create and Edit window since the last standup. It follows the Foundations MVC pattern: the view builds the controls, the controller validates every field through the entity class before anything is stored, and the model carries the state. Every field that benefits from coaching, like the description and the title, routes through the coaching hooks described in AICoaching, while the hard length and format checks stay mandatory exactly as in TP1.

Before the next standup I will finish the read-only view window for a saved lesson and take the source and Javadoc screenshots for Task 4. Karan is finishing the list and search window. Pranjal is iterating the tests. Nothing is blocking me. The concern we logged is video size: every recording goes to the Zoom cloud so each file stays under 100 MB, which is now its own norm because an oversized video can zero the whole project.

Script 5. Pranjal. Standup of 22 October

This is Pranjal, summarising our standup on the twenty second of October. All five were there.

On the board the code is complete and we are in documentation and testing. I want to cover the tests. There is now one suite per CRUD area plus a `TP2TestRunner` that runs them all and totals the result, the same shape as the `TP1TestRunner` we wrote last phase. Every Contributor requirement has at least one positive test and one negative test, and the Requirements to Tests Map lists each requirement next to the test names and the Javadoc HTML file that documents them.

AICoaching is finished: five prioritized input fields, one owner each, each with a mockup, a concept of operations, prioritized requirements, a free tool, and a citation. Before the next standup I will generate the test Javadoc into `ContributorTests_Javadocs` and take the source screenshots. Nothing is blocking anybody. The only concern is time on the screencasts, and we agreed to record all of them together in one session, which the TA confirmed is allowed.

Script 6. Arush. Standup of 24 October

This is Arush, summarising our final TP2 standup on the twenty fourth of October. All five were there.

On the board everything is Done or in final review. Both entity classes are complete with Javadoc in `Lessons_Learned_Javadocs`. The GUI MVC packages are complete with Javadoc in `Contributor_Javadocs`. The tests pass and are documented in `ContributorTests_Javadocs`, with the Requirements to Tests Map listing every requirement. AICoaching, the track-changes Team Norms, and six Plan and Status PDFs with matching summary screencasts are all in the folder.

What is left is mechanical and we are finishing it now: record the three main screencasts together, confirm every video is under 100 MB, delete stray .DS_Store files, zip the TP2 folder, upload a safety copy early, and each of us completes the peer evaluation and confirms the Canvas submission. Nothing is blocking us. We are submitting well before the deadline so the whole team can verify it on Canvas.
